Innovaccer Hiring Team

Re: Senior Product Manager, AI (req 4483), Noida

I am applying for the Senior Product Manager, AI role in Noida. The part that reads like my own work is the evaluation side. At CAMP Systems I built an AI test-case generator grounded through retrieval on roughly 2,000 of our own ticket-to-test conversions, using an Upstash vector index and dense embeddings, and the model was never the hard part. Deciding what a good output actually was, before I could move the number, was the hard part. Test coverage went from 62% to 81% while we were migrating a monolith to microservices, which is the direction coverage usually falls, and it shipped inside an enterprise rather than a demo: 75 customers moved off competing platforms with zero operational downtime and 104% YoY ARR growth two years running.

Honestly, what got my attention is that Gravity is a platform and not a feature. Powering automation and decision-making across a lot of downstream workflows means the AI has to be somebody else's dependency, and that changes what you are allowed to ship and how you version it. Agentic systems are my day job now. I founded SpecHawk, a deploy-aware agentic QA platform that maps a staging environment, generates and executes test specs, and hands back screenshot evidence, built on TypeScript, NestJS and Playwright workers behind Redis job queues. Four enterprise design partners and \$100K of pre-seed on a SAFE at a \$1M cap.

I should name the gap rather than let you find it. You ask for five to eight years and I am at four, and I have not worked on healthcare or clinical workflows, so that domain is something I would be learning from your clinical and data teams. What I am not coming in to learn is LLM and retrieval product work, or what it takes to get an enterprise release out with zero surprises. I am in Navi Mumbai, happy to relocate to Noida, and I can start Monday 31 August 2026. I would welcome the chance to talk. Thank you for your consideration.

Sincerely,

Sahil Sapra
