Re: Senior Product Manager, APIs

I am applying for the Senior Product Manager, APIs role. The requirement most postings would never write down is the one I want to answer first: you ask for someone who can sit in Cursor or Claude Code and ship working code rather than hand over a spec. I do that as a matter of routine. At CAMP Systems I built a LaunchDarkly API-based JavaScript web application in Cursor because the vendor dashboard was flag-centric while our workflow was release-centric and the seats were expensive, and it cut team OPEX 7%. Nobody asked me for it. Today I run product at SpecHawk, an agentic QA platform where the V2 and V3 builds include a developer CLI and a GitHub integration, so API surface and developer experience are the thing I think about most days.

On the API work itself: at CAMP I led the technical discovery into a legacy monolithic aviation platform and its decomposition into domain-driven microservices in Java, Spring Boot, TypeScript and Angular, with reusable RESTful APIs, caching, RxJS observables and lazy loading. That cut data retrieval latency 68% and eliminated the enterprise timeouts. What I would point to is not the number but how it was found. Consensus said we needed more infrastructure. I traced request-level timing instead, found synchronous retrieval paths and no caching, and made the architecture case against the room. That habit of going and looking is the same one behind the LaunchDarkly rollout, which stalled at first because I had built my own mental model rather than theirs. I watched real users attempt the real task, rebuilt around their friction, and release frequency went up 400%. I have not shipped an internal tool without doing that since.

Two things you should weigh honestly. I have four years in product management, and I have no payroll, HR or benefits background, so the domain is something I would be learning. What I would not be learning is API design, service decomposition, data mapping across enterprise systems, or owning a thing through to adoption when it is a customer's live operation on the other end. I noticed the requisition is scoped to your EMEA region while the posting says everyone is welcome to apply. I am in Charlotte, North Carolina, authorized to work in the United States without sponsorship, and happy to be told this is the wrong region for me. I can start as soon as you need. Thank you for reading.

Sincerely,
